Designing, Building & Consulting

Concrete Floors as per TR 34 Guidelines for Industries/Warehouses/Manufacturing Units

The performance of a floor depends on its design, specifications and the technique used in its construction. It starts with understanding the requirement of: How the floor will be used? At Master Floors, we understand the importance and significance of the floor in warehousing/ industrial sector. While designing the floor, we consider all parameters and known load factors, floor impact, MHE traffic, floor finishing and accordingly choose the right method and material to deliver the best floor. A successfully constructed floors are a results of an integrated and detailed planning process that focuses on the current and potential future use of the floor. From the beginning of the project of Road and Flooring work, we give high importance to soil compaction, GSB compaction, WMM compaction as per IS code/TR 34 Guidelines.

The requirement for concrete industrial ground floor include the following.

- The floor should be serviceable, assuming planned maintenance and no gross misuse or overloading.
- The floor must be able to carry the required static point loads. uniformly distributed loads and dynamic loads, without unacceptable deflection, cracking, settlement or damage to joints.
- Joint layout should be taken into account, the location of racking uprights or mezzanine floor columns.
- Joints should be robust in both design and construction.
- Joints and reinforcement should be detailed to minimise the risk of cracking.
- The Floor surface should have suitable surface regularity.
- The Floor surface should have suitable abrasion, chemical and slip resistance.
- The Floor should have the required type of finish.
